

Role Title – Head of AI & Business Development

Responsibilities

Pillar 1: AI Product Strategy & Execution

Define and own the AI product roadmap – Map the four AI pillars against BOP's product tiers and commercial timeline. Prioritize what ships first and why.

- **Build the predictive analytics engine** – Turn Presence's Wi-Fi sensing data and Monitor's activity streams into anomaly detection models that predict falls, wandering, and health deterioration before they happen. Own the ML pipeline from training data to production inference.
- **Develop the Voice AI layer** – Architect speech analysis on BOP Button calls: distress detection, cognitive decline markers, severity auto-triage. Directly enhances the 24/7 Response Centre's effectiveness.
- **Ship GenAI caregiver experience** – Auto-summarized activity reports, conversational check-in interfaces, personalized care recommendations through the BOP App. Caregiver retention play.
- **Champion privacy-first / edge AI** – Ensure all AI features process sensitive data locally where possible. BOP's "no cameras, no wearables" brand promise is a strategic differentiator, the AI architecture must honour it. Federated learning, on-device inference, and minimal cloud data are the constraints.

Pillar 2: BD on Partnerships that focus on Healthcare & Government

- Own the healthcare partnership pipeline - Build relationships with hospitals, eldercare agencies, insurers, and government health bodies. Structure pilot programs, outcome-based contracts, and multi-year deployments.
- Navigate local government partnerships and grants – Leverage iWOW's government track record (TraceTogether) to open doors apply grants to develop AI-powered eldercare products.
- Drive international market entry – Develop BOP's products with AI-augmentation, and market beyond Singapore. Adapt product and GTM for regulatory environments in target countries (starting with Australia, Japan and US).

Cross-Pillar

- Translate between worlds – Ensure AI capabilities are sold correctly (not over-promised) and BD commitments are technically feasible (not over-committed).

Qualifications

Must-Have

- 10+ years in technology product leadership, with at least 5 years in AI/ML-driven products that have shipped to production at scale
- Proven track record closing healthcare or government technology partnerships, regulated procurement (pilot programs, outcome-based contracts, or national-scale deployments)
- Hands-on AI experience - has built or directly overseen ML pipelines (not just managed teams that build them). Understands model lifecycle, data requirements, and inference constraints
- Privacy-first design orientation - experience building products that handle sensitive personal data (health, location, behavioural) under regulatory frameworks (PDPA, HIPAA, or equivalent)
- APAC market familiarity - has worked in or sold to markets across Southeast Asia, East Asia, or Oceania. Understands healthcare system variation and government procurement cultures
- Bilingual or multilingual preferred , English mandatory; valued given BOP's existing multi-language support and regional expansion

Nice-to-Have

- Experience in AgeTech, digital health, or IoT platforms – domain knowledge that accelerates the learning curve
- Prior role at a Series A - E startup that scaled from regional to international markets
- Familiarity with Wi-Fi sensing, edge computing, or federated learning – matches BOP's tech stack
- Network of healthcare decision-makers in government agencies

Success Metrics

First 90 Days

1. AI Product Audit - Complete a technical audit of BOP's existing data infrastructure (Presence sensor data, Button call recordings, Monitor activity logs) and deliver a feasibility assessment for each AI pillar
2. BD Pipeline - Identify and begin engagement with partnerships that work with healthcare/government prospects; secure at least 1 letter of intent or pilot agreement
3. AI Roadmap v1 - Present a prioritized 18-month AI product roadmap to the board, with resource requirements and commercial milestones

First Year

4. Ship 1-2 AI-related MVP – for example, deploy anomaly detection on Presence data for at least 1 pilot cohort (100+ seniors), demonstrating measurable improvement in early intervention rates
5. Close 2+ Healthcare/HealthTech - Signed contracts with eldercare public/private entities, or government health bodies, including at least 1 outside Singapore
6. Revenue Attribution - AI-enabled features and partnerships contributing measurable revenue or reducing Response Centre costs by a defined percentage

Compensation Framework

- Base: Competitive package for SG market
- Equity: iWOW stock options with 4-year vest (parent company is publicly listed)
- Variable: Performance bonus tied to revenue and AI product milestones
- Benefits: health insurance, transport and device allowance

Reporting & Location

- Reports to: JY Chen
- Location: Singapore with regional travel, as required
- Team: Builds and leads a cross-functional AI/BD team (2-3 hires after first significant deal)
